

Prepared and compiled for home and correspondence study, this collection of instruction papers is a very complete technical reference for those wishing to learn design for weaving. It covers basic design, drafting, various weaving techniques, and costs of operation. Each section ends with a list of exercises, and exam questions are presented at the back of the book. It is profusely illustrated with weaving diagrams and also contains interesting pictures of commercial machinery. This is a book well worth having on any teacher's shelf, as well as in the library of anyone wanting to increase knowledge of weaving from beginning to advanced techniques.
